GALE Printing

1. Overview 1

2. Network Requirements 1

3. Firewall Ports/Rules 2

1. Overview

The following document outlines how to enable printing from GALE

2. GALE print services

GALE is set up by default to use Android print services. On most tablets, this can be accessed via the print services setting. The default print service is set up to discover Wi-Fi-enabled printers on the same network as the GALE device. The Default settings allow GALE to print to a PDF file or a connected Wi-Fi printer.

If your GALE device is in a sensitive location it is recommended to set the GALE device and any related printers on a private network with protected access as the data sent to the printer is sensitive data and may contain private health information.

3. Adding a printer

Printers can be added to the GALE device through the print services setting or from the GALE app. To add a printer from the GALE app, go to the health history page, click the share data checkbox, and click the Print button.

This will bring up the Android print manager. Click the All printers selection. On the All Printers page, there is an option to add a printer. Click that and follow the prompts to add your printer if it is not already there.

You can also add additional print services from that screen through the Google Play Store.

This link is a good article on how to set up printers on your tablet
